Continuous improvement is a way of life at Greer Steel. By investing in our equipment, we ensure our capabilities are state-of-the-art and in sync with our customers' needs.

Recently, by upgrading our rolling mills, Greer unclogged some production bottlenecks, improved our efficiency and enhanced the quality of our products. The most significant upgrades were on the 30" mill and included:

- *Reworked gearboxes for improved throughput*
- *Enhanced guide box for better edge quality*
- *Optimized roll cooling*
- *Enhanced gauge system response time for improved Cpk performance*
- *Reworked screw-down cylinders to minimize down time*
- *Redesigned spindle jacks to minimize potential delays*
- *Improved design coolant valves to minimize potential surface defects*

As always, our goal is to do whatever is necessary to ensure we provide quality strip and flat wire that meets the highest performance and delivery needs.

Sincerely,

John R. Raese, President
