I am pleased to tell you that Greer has expanded annealing capacity at the Dover facility with the addition of two new Ebner 100% hydrogen annealing bases.

The new equipment increases both capacity and capabilities, allowing for faster cycle times and processing of an expanded range of products. Additionally, the utilization of a 100% hydrogen annealing atmosphere provides excellent surface cleanliness and Rockwell consistency throughout the material.

With the addition of these bases, Greer now has fourteen annealing bases and nine furnaces. All working to answer our customers' needs for material that consistently provides superior, uniform mechanical properties and surface cleanliness that is ideal for plating/surface critical applications.

Ebner Annealing Capabilities:

- Max OD: 72"
- Max stack height: 154"
- Atmosphere: 100% hydrogen
- Capable of providing fully spheroidized carbon steel through 400 series (Martensitic) stainless products

Through our persistent investment in equipment, Greer Steel is staying on the forefront of technology, which allows us to stay in step with your most critical requirements.

Sincerely,

John R. Raese, President
